

- Sub 1
D1
14. A digital amplifier, comprising:
a summation circuit for summing an input signal with a feedback signal, and generating a summed output signal;
a noise shaping network with an input coupled to the output of the summation circuit and generating a noise shaped signal;
a sampling stage with an input connected to the output of the noise shaping network, and generating a sampled signal, the sampling stage having a predetermined sampling frequency, and generating an output signal with a lower transition rate with respect to the sampling frequency by a predetermined multiple;
a feedback loop providing the output of the sampling stage coupled directly to the summation circuit; and
an output stage with inputs connected to the output of the sampling stage and generating an output signal.
15. The digital amplifier of claim 14, wherein the output stage includes an H-bridge controller.
16. The digital amplifier of claim 14, wherein the sampling stage further comprises a logic circuit for suppressing sampling of the input signal for a set number of clock cycles of the sampling frequency clock.
17. The digital amplifier of claim 16, wherein the logic circuit further includes a transition detector for detecting a transition in the output signal.
18. The digital amplifier of claim 14, wherein the output signal of the sampling stage has a multi-state output, with at least three states.
19. The digital amplifier of claim 14, wherein the noise shaping network comprises a plurality of integrator stages.
20. A digital amplifier, comprising:

a summation circuit for summing an input signal with a feedback signal, and generating a summed output signal;

a noise shaping network with an input coupled to the output of the summation circuit and generating a noise shaped signal;

a sampling stage with an input connected to the output of the noise shaping network, and generating an output signal with a multi-state output, with an least three states;

a feedback loop providing the output of the sampling stage coupled directly to the summation circuit; and

an output stage with inputs connected to the output of the sampling stage and generating an output signal.

21. The digital amplifier of claim 14, wherein the output stage includes a semiconductor H-bridge controller.

22. The digital amplifier of claim 14, wherein the sampling circuit generates an output signal with a lower transition rate with respect to the sampling frequency by a predetermined multiple.

23. The digital amplifier of claim 14, wherein the sampling circuit further comprises a logic circuit for suppressing sampling of the input signal for a set number of clock cycles of the sampling frequency clock.

24. The digital amplifier of claim 17, wherein the logic circuit further comprises a transition detector for detecting a transition in the output signal.

25. The digital amplifier of claim 14, wherein the noise shaping network comprises a plurality of integrator stages.

28. A method of digital amplification, comprising:
summing an input signal with a feedback signal and generating a summed output signal;

DR
cont.

noise shaping the summed output signal to generate a noise shaped signal;
sampling the noise shaped signal at a predetermined sampling frequency and
generating a sampled output signal with a lower transition rate with respect to the predetermined
sampling frequency by a predetermined multiple;
feeding back the sampled output signal as the feedback signal; and
outputting the sampled output signal as an output signal.

29. The method of digital amplification of claim 28, further comprising outputting the
sampled output signal through an H-bridge controller.

30. The method of digital amplification of claim 28, wherein the sampling includes
suppressing sampling of the noise shaped signal for a set number of clock cycles of a sampling
frequency clock.

31. The method of digital amplification of claim 30, wherein the suppressing sampling
includes detecting a transition in the sampled output signal.

32. The method of digital amplification of claim 28, wherein the outputting includes
outputting a multi-state output signal with at least three states.

33. The method of digital amplification of claim 28, wherein the noise shaping includes
integrating the summed output signal through a plurality of integrator stages.

34. A method of digital amplification, comprising:
summing an input signal with a feedback signal and generating a summed output
signal;
noise shaping the summed output signal and generating a noise shaped signal;
sampling the noised shaped signal and generating a sampled output signal;
feeding back the sampled output signal as the feedback signal; and
generating a multi-state output signal having at least three states using the
sampled output signal.
